DAA EXPERIMENT 2

Common Elements Between Two Arrays

Aim

To find the common elements between two arrays using Python.

Algorithm

1. Start.
2. Read the elements of the first array.
3. Read the elements of the second array.
4. Compare each element of the first array with the elements of the second array.
5. If a match is found, display the common element and stop checking the second array for that element.
6. Stop.

Program

```
# Find common elements between two arrays

n = int(input("Enter size of first array: "))
arr1 = []

for i in range(n):
    arr1.append(int(input("Enter element: ")))

m = int(input("Enter size of second array: "))
arr2 = []

for i in range(m):
    arr2.append(int(input("Enter element: ")))

print("Common elements:")

for i in arr1:
    for j in arr2:
        if i == j:
            print(i)
            break
```

Output

```
Enter size of first array: 5
Enter element: 10
Enter element: 20
Enter element: 30
Enter element: 40
Enter element: 50
Enter size of second array: 5
Enter element: 30
Enter element: 40
Enter element: 50
Enter element: 60
Enter element: 70
Common elements:
30
40
50

```

Result

Thus, the common elements between two arrays were successfully found.
